

ABSTRACT OF THE DISCLOSURE

Display devices and methods for operating a display device are provided. A display device has a source of an original image and a display. A user input system is adapted to generate a non-directional signal in response to a user input action. A controller is provided and is adapted to detect the non-directional signal and to successively designate a different one of a set of portions of the original image in response to each non-directional signal. The controller is further adapted to cause the display to present a portion evaluation image showing the currently designated portion of the original image and to determine an area of importance in the original image based upon the currently designated portion. At least one of the portions of the set of portions of the original image is non-central with respect to the original image.
